Let $p \ge 1$, and $B: \ell^p \to \ell^p$ be the unilateral backward shift de ned by $B(a_0, a_1, a_2, \ldots) = (a_1, a_2, a_3, \ldots)$.

• Rolewicz (1969): If $t \in (1, \infty)$, then there exists a vector x in ℓ^p so that $\{x, (tB)x, (tB)^2x, (tB)^3x, \ldots\}$ is dense in ℓ^p .

Hypercyclicity Criterion

Let X be a separable, in nite-dimensional Banach space over \mathbb{C} , and $B(X) = \{T : X \to X | T \text{ is bounded and linear} \}$.

Hypercyclicity Criterion

Let X be a separable, in nite-dimensional Banach space over \mathbb{C} , and $B(X) = \{T : X \to X | T \text{ is bounded and linear}\}.$

De nition. A bounded linear operator T in B(X) is <u>hypercyclic</u> if there is a vector x whose orbit orb $(T, x) = \{x, Tx, T^2x, T^3x, ...\}$ is dense in X. Such a vector x is called a <u>hypercyclic vector</u>.

Hypercyclicity Criterion

Let X be a separable, in nite-dimensional Banach space over \mathbb{C} , and $B(X) = \{T : X \to X | T \text{ is bounded and linear}\}.$

De nition. A bounded linear operator T in B(X) is <u>hypercyclic</u> if there is a vector x whose orbit $orb(T, x) = \{x, Tx, T^2x, T^3x, ...\}$ is dense in X. Such a vector x is called a <u>hypercyclic vector</u>.

• Kitai (1982), Gethner and Shapiro (1987): $T: X \to X$ is hypercyclic if there is a dense set D of X and T has a right inverse S so that $T^n x \to 0$ and $S^n x \to 0$ for each vector $x \in D$.

 $\overline{\operatorname{orb}(T,x)} = \overline{\{x,Tx,T^2x,T^3x,\ldots\}}$ = the smallest closed invariant subset containing x.

 $\overline{\operatorname{orb}(T,x)} = \overline{\{x,Tx,T^2x,T^3x,\ldots\}}$ = the smallest closed invariant subset containing x.

 $\overline{\text{span orb}(T, x)} = \overline{\{p(T)x : p \text{ is a polynomial}\}} = \text{the smallest closed invariant subspace containing } x.$

 $\overline{\operatorname{orb}(T,x)} = \overline{\{x,Tx,T^2x,T^3x,\ldots\}}$ = the smallest closed invariant subset containing x.

 $\overline{\text{span orb}(T, x)} = \overline{\{p(T)x : p \text{ is a polynomial}\}} = \text{the smallest closed invariant subspace containing } x.$

Invariant Subspace Problem (1920s, still open today): Must every bounded linear operator $T: H \to H$ on an in nite dimensional separable Hilbert space H have a nontrivial invariant subspace?

 $\overline{\operatorname{orb}(T,x)} = \overline{\{x,Tx,T^2x,T^3x,\ldots\}}$ = the smallest closed invariant subset containing x.

 $\overline{\text{span orb}(T, x)} = \overline{\{p(T)x : p \text{ is a polynomial}\}} = \text{the smallest closed invariant subspace containing } x.$

Invariant Subspace Problem (1920s, still open today): Must every bounded linear operator $T: H \to H$ on an in nite dimensional separable Hilbert space H have a nontrivial invariant subspace?

• En o (1987): Not if the space is ℓ^1 . That is, there is an operator \mathcal{T} on ℓ^1 for which every nonzero vector x has the property that $\overline{\text{span orb}(\mathcal{T}, x)} = \ell^1$.

 $\overline{\operatorname{orb}(T,x)} = \overline{\{x,Tx,T^2x,T^3x,\ldots\}}$ = the smallest closed invariant subset containing x.

 $\overline{\text{span orb}(T, x)} = \overline{\{p(T)x : p \text{ is a polynomial}\}} = \text{the smallest closed invariant subspace containing } x.$

Invariant Subspace Problem (1920s, still open today): Must every bounded linear operator $T: H \to H$ on an in nite dimensional separable Hilbert space H have a nontrivial invariant subspace?

- En o (1987): Not if the space is ℓ^1 . That is, there is an operator \mathcal{T} on ℓ^1 for which every nonzero vector x has the property that $\overline{\text{span orb}(\mathcal{T}, x)} = \ell^1$.
- Read (1989): There is an operator T on ℓ^1 with no nontrivial closed invariant subset. That is, every nonzero vector x has the property that $\overline{\text{orb}(T,x)} = \ell^1$.

If X

If X is nite dimensional, no operator T on X is hypercyclic.

Proof: Take $X = \mathbb{C}^n$. The adjoint $T^* : \mathbb{C}^n \to \mathbb{C}^n$ has an eigenvalue $\alpha \in \mathbb{C}$. Suppose $T^*y = \alpha y$.

If X is nite dimensional, no operator T on X is hypercyclic.

Proof: Take $X = \mathbb{C}^n$. The adjoint $T^* : \mathbb{C}^n \to \mathbb{C}^n$ has an eigenvalue $\alpha \in \mathbb{C}$. Suppose $T^*y = \alpha y$. Then for any vector $x \in \mathbb{C}^n$,

$$=< x, T^{*n}y>=< x, \alpha^{n}y>= \ \alpha^{n}< x, y>,$$

which cannot be dense in \mathbb{C} . \square

If X is nite dimensional, no operator T on X is hypercyclic.

Proof: Take $X = \mathbb{C}^n$. The adjoint $T^* : \mathbb{C}^n \to \mathbb{C}^n$ has an eigenvalue $\alpha \in \mathbb{C}$. Suppose $T^*y = \alpha y$. Then for any vector $x \in \mathbb{C}^n$,

$$< T^{n}X, y > = < X, T^{*n}y > = < X, \alpha^{n}y > = \alpha^{n} < X, y >,$$

which cannot be dense in \mathbb{C} . \square

Back to the case when *X* is in nite dimensional.

If X is nite dimensional, no operator T on X is hypercyclic.

Proof: Take $X = \mathbb{C}^n$. The adjoint $T^* : \mathbb{C}^n \to \mathbb{C}^n$ has an eigenvalue $\alpha \in \mathbb{C}$. Suppose $T^*y = \alpha y$. Then for any vector $x \in \mathbb{C}^n$,

$$< T^{n}x, y > = < x, T^{*n}y > = < x, \alpha^{n}y > = \alpha^{n} < x, y >,$$

which cannot be dense in \mathbb{C} . \square

Back to the case when *X* is in nite dimensional.

If $F: X \to X$ has nite rank (that is, dim ran $F < \infty$), then I + F is not hypercyclic.

If X is nite dimensional, no operator T on X is hypercyclic.

Proof: Take $X = \mathbb{C}^n$. The adjoint $T^* : \mathbb{C}^n \to \mathbb{C}^n$ has an eigenvalue $\alpha \in \mathbb{C}$. Suppose $T^*y = \alpha y$. Then for any vector $x \in \mathbb{C}^n$,

$$< T^{n}x, y > = < x, T^{*n}y > = < x, \alpha^{n}y > = \alpha^{n} < x, y >,$$

which cannot be dense in \mathbb{C} . \square

Back to the case when X is in nite dimensional.

If $F: X \to X$ has nite rank (that is, dim ran $F < \infty$), then I + F is not hypercyclic.

If $T: X \to X$ is compact, then T is not hypercyclic.

If X is nite dimensional, no operator T on X is hypercyclic.

Proof: Take $X = \mathbb{C}^n$. The adjoint $T^* : \mathbb{C}^n \to \mathbb{C}^n$ has an eigenvalue $\alpha \in \mathbb{C}$. Suppose $T^*y = \alpha y$. Then for any vector $x \in \mathbb{C}^n$,

Unilateral Weighted Backward Shifts on ℓ^p

 $T:\ell^p \to \ell^p$ is said to be a <u>unilateral weighted backward shift</u> if there is a bounded positive weight sequence $\{w_j: j \geq 1\}$ such that

$$T(a_0, a_1, a_2, \ldots) = (w_1 a_1, w_2 a_2, w_3 a_3, \ldots).$$

Unilateral Weighted Backward Shifts on ℓ^p

 $T: \ell^p \to \ell^p$ is said to be a <u>unilateral weighted backward shift</u> if there is a bounded positive weight sequence $\{w_j: j \geq 1\}$ such that

$$T(a_0, a_1, a_2, \ldots) = (w_1 a_1, w_2 a_2, w_3 a_3, \ldots).$$

• Salas (1995): A unilateral weighted backward shift T is hypercyclic if and only if $\sup\{w_1w_2\cdots w_n:n\geq 1\}=\infty$.

Unilateral Weighted Backward Shifts on ℓ^p

 $T: \ell^p \to \ell^p$ is said to be a <u>unilateral weighted backward shift</u> if there is a bounded positive weight sequence $\{w_j: j \geq 1\}$ such that

$$T(a_0, a_1, a_2, \ldots) = (w_1 a_1, w_2 a_2, w_3 a_3, \ldots).$$

- Salas (1995): A unilateral weighted backward shift T is hypercyclic if and only if $\sup\{w_1w_2\cdots w_n:n\geq 1\}=\infty$.
- Grosse-Erdmann (2000): Generalizations to Frechet spaces.

Bilateral Weighted Shifts on ℓ^p

 $T: \ell^p \to \ell^p$ is a <u>bilateral weighted backward shift</u> if there is a bounded positive weight sequence $\{w_j: j \in \mathbb{Z}\}$ such that

$$T(\dots, a_{-1}, \overbrace{a_0}^{\text{zeroth}}, a_1, \dots) = (\dots, w_{-1}a_{-1}, w_0a_0, \overbrace{w_1a_1}^{\text{zeroth}}, w_2a_2, \dots).$$

Bilateral Weighted Shifts on ℓ^p

 $T: \ell^p \to \ell^p$ is a <u>bilateral weighted backward shift</u> if there is a bounded positive weight sequence $\{w_j: j \in \mathbb{Z}\}$ such that

$$T(\dots, a_{-1}, \overbrace{a_0}^{\text{zeroth}}, a_1, \dots) = (\dots, w_{-1}a_{-1}, w_0a_0, \overbrace{w_1a_1}^{\text{zeroth}}, w_2a_2, \dots).$$

• Salas (1995): A bilateral weighted shift T is hypercyclic if and only if for any $\epsilon > 0$, and $q \in \mathbb{N}$, there is an arbitrarily large n such that whenever $|k| \leq q$,

$$\prod_{j=1}^{n} w_{k+j} > \frac{1}{\epsilon} \quad \text{and} \quad \prod_{j=0}^{n-1} w_{k-j} < \epsilon.$$

 with Sanders (2009): Between any two hypercyclic unilateral weighted backward shifts, there is a path of such operators with a dense G set of common hypercyclic vectors. Also, there is a path of such operators with no common hypercyclic vectors.

- with Sanders (2009): Between any two hypercyclic unilateral weighted backward shifts, there is a path of such operators with a dense G set of common hypercyclic vectors. Also, there is a path of such operators with no common hypercyclic vectors.
- Corollary: The hypercyclic unilateral weighted backward shifts form a path-connected subset in the operator algebra.

- with Sanders (2009): Between any two hypercyclic unilateral weighted backward shifts, there is a path of such operators with a dense G set of common hypercyclic vectors. Also, there is a path of such operators with no common hypercyclic vectors.
- Corollary: The hypercyclic unilateral weighted backward shifts form a path-connected subset in the operator algebra.
- The same holds true for bilateral weighted shifts.

- with Sanders (2009): Between any two hypercyclic unilateral weighted backward shifts, there is a path of such operators with a dense G set of common hypercyclic vectors. Also, there is a path of such operators with no common hypercyclic vectors.
- Corollary: The hypercyclic unilateral weighted backward shifts form a path-connected subset in the operator algebra.
- The same holds true for bilateral weighted shifts.

Natural Question: Can we have \a lot" of operators in a path and yet their common hypercyclic vectors still form a dense G subset? What do we mean by \a lot"?

Existence of Hypercyclic Operators

 Ansari (1997): For every separable, in nite dimensional Banach space X, there is a hypercyclic operator T in B(X).

Existence of Hypercyclic Operators

• Ansari (1997): For every separable, in nite dimensional Banach space X, there is a hypercyclic operator T in B(X).

De nition. A vector $x \in X$ is said to be a <u>periodic point</u> of an operator T in B(X) if there is a positive integer n such that $T^nx = x$.

De nition. An operator on X is said to be <u>chaotic</u> if and only if it is hypercyclic and has a dense set of periodic points.

Existence of Hypercyclic Operators

• Ansari (1997): For every separable, in nite dimensional Banach space X, there is a hypercyclic operator T in B(X).

De nition. A vector $x \in X$ is said to be a <u>periodic point</u> of an operator T in B(X) if there is a positive integer n such that $T^nx = x$.

De nition. An operator on X is said to be <u>chaotic</u> if and only if it is hypercyclic and has a dense set of periodic points.

 Bonet & Mart nez-Gimenez & Peris (2001): There is a separable, in nite dimensional Banach space which admits no chaotic operator.

A Zero-One Law for Chaotic Operators

SOT = Strong Operator Topology of the operator algebra B(X).

• (2002): For a separable, in nite dimensional Hilbert space *H*, the hypercyclic operators on *H* are SOT-dense in *B*(*H*).

A Zero-One Law for Chaotic Operators

SOT = Strong Operator Topology of the operator algebra B(X).

- (2002): For a separable, in nite dimensional Hilbert space H, the hypercyclic operators on H are SOT-dense in $\mathcal{B}(H)$.
- with Bes (2003): The set of chaotic operators on a separable, in nite dimensional Banach space X is either empty or SOT-dense in $\mathcal{B}(X)$.

A Zero-One Law for Chaotic Operators

SOT = Strong Operator Topology of the operator algebra B(X).

- (2002): For a separable, in nite dimensional Hilbert space H, the hypercyclic operators on H are SOT-dense in B(H).
- with Bes (2003): The set of chaotic operators on a separable, in nite dimensional Banach space X is either empty or SOT-dense in $\mathcal{B}(X)$.

Indeed, if $T \in B(X)$ is hypercyclic, then its conjugate class, or similarity orbit, $\{A^{-1}TA : A \text{ invertible on } X\}$ is SOT-dense in B(X).

A Double Density Theorem

Let H be separable, in nite dimensional Hilbert space over \mathbb{C} .

• with Sanders (2011): There is a path of chaotic operators in B(H) that is SOT-dense in B(H), and each operator on the path shares the exact same set \mathcal{G} of common hypercyclic vectors.

A Double Density Theorem

Let H be separable, in nite dimensional Hilbert space over \mathbb{C} .

- with Sanders (2011): There is a path of chaotic operators in B(H) that is SOT-dense in B(H), and each operator on the path shares the exact same set \mathcal{G} of common hypercyclic vectors.
- Corollary: The path can be taken so that each operator along the path satis es the hypercyclicity criterion.

A Double Density Theorem

Let H be separable, in nite dimensional Hilbert space over \mathbb{C} .

- with Sanders (2011): There is a path of chaotic operators in B(H) that is SOT-dense in B(H), and each operator on the path shares the exact same set \mathcal{G} of common hypercyclic vectors.
- Corollary: The path can be taken so that each operator along the path satis es the hypercyclicity criterion.
- Corollary: The hypercyclic operators in B(H) are SOT-connected.
- Corollary: The hypercyclic operators T in B(H) with $\mathcal{G} \subset \mathcal{HC}(T)$ are SOT-connected.

For an operator $T: X \to X$ on a Banach space X, we let $S(T) = \{A^{-1}TA \mid A \text{ invertible}\}\$ be the similarity orbit of T.

For an operator $T: X \to X$ on a Banach space X, we let $S(T) = \{A^{-1}TA \mid A \text{ invertible}\}\$ be the similarity orbit of T.

• with Sanders (2011): S(T) contains a path of operators which is SOT-dense in B(X) and for which the set of common hypercyclic vectors for the whole path is a dense G set.

For an operator $T: X \to X$ on a Banach space X, we let $S(T) = \{A^{-1}TA \mid A \text{ invertible}\}\$ be the similarity orbit of T.

• with Sanders (2011): S(T) contains a path of operators which is SOT-dense in B(X) and for which the set of common hypercyclic vectors for the whole path is a dense G set.

Observations of some zero-one phenomenon:

For an operator $T: X \to X$ on a Banach space X, we let $S(T) = \{A^{-1}TA \mid A \text{ invertible}\}\$ be the similarity orbit of T.

• with Sanders (2011): S(T) contains a path of operators which is SOT-dense in B(X) and for which the set of common hypercyclic vectors for the whole path is a dense G set.

Observations of some zero-one phenomenon:

- (1) If $\mathcal{HC}(T) = X \setminus \{0\}$, the set of common hypercyclic vectors for $\mathcal{S}(T)$ is also $X \setminus \{0\}$.
- (2) If $\mathcal{HC}(T) \neq X \setminus \{0\}$, the set of common hypercyclic vectors for $\mathcal{S}(T)$ is empty.

```
For an operator T on a Hilbert space H, we let \mathcal{U}(T) = \{ \quad \} = \infty \qquad \{ \qquad \qquad \{ \qquad \in \quad \in \}
```

For an operator T on a Hilbert space H, we let $\mathcal{U}(T) = \{U^{-1}TU : U \text{ unitary}\}$, the unitary orbit of T.

{unitary operators on H} path connected $\implies \mathcal{U}(T)$ path connected.

For an operator T on a Hilbert space H, we let $\mathcal{U}(T) = \{U^{-1}TU : U \text{ unitary}\}$, the unitary orbit of T.

{unitary operators on H} path connected $\implies \mathcal{U}(T)$ path connected.

Every operator in $\mathcal{U}(T)$ has the same norm as T. So $\mathcal{U}(T)$ does not contain a path that is SOT-dense in B(H).

For an operator T on a Hilbert space H, we let $\mathcal{U}(T) = \{U^{-1}TU : U \text{ unitary}\}$, the unitary orbit of T.

{unitary operators on H} path connected $\implies \mathcal{U}(T)$ path connected.

Every operator in $\mathcal{U}(T)$ has the same norm as T. So $\mathcal{U}(T)$ does not contain a path that is SOT-dense in B(H).

• with Sanders (2012): If $T \in B(H)$ be hypercyclic, then $\mathcal{U}(T)$ contains a path \mathcal{P} of operators so that $\overline{\mathcal{P}}^{SOT}$ contains $\mathcal{U}(T)$ and the common hypercyclic vectors for \mathcal{P} is a dense G set.

- with Seceleanu (2012): Let $T: \ell^p \to \ell^p$ be a unilateral weighted backward shift. The following are equivalent:
- (A) T is hypercyclic.
- (B) There is a vector whose orbit has a nonzero limit point.
- (C) There is a vector whose orbit has a nonzero weak limit point.
- (D) There is a vector whose orbit has in nitely many members contained in an open ball whose closure avoids the origin.

Corollary: T is not hypercyclic i every orb $(T, x) \cup \{0\}$ is closed. Remark: (A), (B), (D) are equivalent for bilateral weighted shifts.

• with Sanders (2004): A unilateral weighted backward shift is hypercyclic if and only if it is weakly hypercyclic. But, there is a bilateral weighted shift that is weakly hypercyclic but not hypercyclic.

A Remark on Theorem

If orb(T, x) has a nonzero limit point, we can only conclude T is hypercyclic but we cannot conclude that x is a hypercyclic vector, and in fact not even a cyclic vector.

A vector x is a *cyclic vector* for T, if span orb(T, x) is dense in X.

A Remark on Theorem

If orb(T, x) has a nonzero limit point, we can only conclude T is hypercyclic but we cannot conclude that x is a hypercyclic vector, and in fact not even a cyclic vector.

A vector x is a <u>cyclic vector</u> for T, if span orb(T, x) is dense in X. Let (e_n) be the canonical basis of ℓ^p .

- with Seceleanu (preprint, 2013): The vector x is a cyclic vector for T, if
 - (1) the weight $(w_j)_{j=1}^{\infty}$ of T is bounded below, and
 - (2) orb(T, x) has a nonzero limit point f given by $f = a_0 e_0 + \cdots + a_n e_n$ (nite sum) for some scalars a_j .

A Remark on Theorem

If orb(T, x) has a nonzero limit point, we can only conclude T is hypercyclic but we cannot conclude that x is a hypercyclic vector, and in fact not even a cyclic vector.

A vector x is a <u>cyclic vector</u> for T, if span orb(T, x) is dense in X. Let (e_n) be the canonical basis of ℓ^p .

- with Seceleanu (preprint, 2013): The vector x is a cyclic vector for T, if
 - (1) the weight $(w_j)_{j=1}^{\infty}$ of T is bounded below, and
 - (2) orb(T, x) has a nonzero limit point f given by $f = a_0 e_0 + \cdots + a_n e_n$ (nite sum) for some scalars a_j .

There are examples to show both (1) and (2) are needed for x to be a cyclic vector.

Proof of $\backslash (B) \implies (A)$ "

Suppose there exist a vector $x = (x_0, x_1, x_2, ...) \in \ell^p$ and a non-zero vector $f = (f_0, f_1, f_2, ...) \in \ell^p$ such that f is a limit point of the orbit Orb(T, x).

Proof of $\backslash (B) \implies (A)$ "

Suppose there exist a vector $x = (x_0, x_1, x_2, ...) \in \ell^p$ and a non-zero vector $f = (f_0, f_1, f_2, ...) \in \ell^p$ such that f is a limit point of the orbit Orb(T, x).

Since $f_j \neq 0$ for some $j \geq 0$, we assume without loss of generality that $f_0 \neq 0$. Hence there exist an increasing sequence $\{n_k : k \geq 1\} \subset \mathbb{N}$ and an integer N > 0 such that

$$||T^{n_k}x-f||<\frac{1}{2^k}<\frac{|f_0|}{2},$$

for all $k \geq N$. Then

$$T^{n_k} x = T^{n_k} (x_0, x_1, x_2, \ldots) = (w_1 \cdots w_{n_k} x_{n_k}, \ldots).$$

Proof of $\backslash (B) \implies (A)$ "

Suppose there exist a vector $x=(x_0,x_1,x_2,\ldots)\in\ell^p$ and a non-zero vector $f=(f_0,f_1,f_2,\ldots)\in\ell^p$ such that f is a limit point of the orbit $\mathrm{Orb}(T,x)$.

Since $f_j \neq 0$ for some $j \geq 0$, we assume without loss of generality that $f_0 \neq 0$. Hence there exist an increasing sequence $\{n_k : k \geq 1\} \subset \mathbb{N}$ and an integer N > 0 such that

$$||T^{n_k}x-f||<\frac{1}{2^k}<\frac{|f_0|}{2},$$

for all $k \geq N$. Then

$$T^{n_k} x = T^{n_k}(x_0, x_1, x_2, \ldots) = (w_1 \cdots w_{n_k} x_{n_k}, \ldots).$$

Hence $||T^{n_k}x - f|| \ge |w_1 \cdots w_{n_k}x_{n_k} - f_0|$. So there exists a sequence $\{n_k : k \ge 1\}$ such that

$$|w_1 \cdots w_{n_k} x_{n_k} - f_0| < |f_0|/2,$$

for all k > N.

$\backslash (B) \implies (A)$ " Completed

Thus $|f_0|/2 < |w_1 \cdots w_{n_k} x_{n_k}|$ and so $\frac{|f_0|}{2(w_1 \cdots w_{n_k})} < |x_{n_k}|$ for all $k \ge N$. Hence we get that

$$\frac{|f_0|^p}{2^p(w_1\cdots w_{n_k})^p}<|x_{n_k}|^p$$
 , for all $k\geq N$.

Now since $x \in \ell^p$ we have

$$\frac{|f_0|^p}{2^p} \sum_{k=N}^{\infty} \frac{1}{(w_1 \cdots w_{n_k})^p} \leq \sum_{k=N}^{\infty} |x_{n_k}|^p \leq ||x||^p < \infty.$$

$\backslash (B) \implies (A)$ " Completed

Thus $|f_0|/2 < |w_1 \cdots w_{n_k} x_{n_k}|$ and so $\frac{|f_0|}{2(w_1 \cdots w_{n_k})} < |x_{n_k}|$ for all $k \ge N$. Hence we get that

$$\frac{\left|f_{0}\right|^{p}}{2^{p}(w_{1}\cdots w_{n_{k}})^{p}}<\left|\textit{X}_{n_{k}}\right|^{p}$$
 , for all $k\geq N$.

Now since $x \in \ell^p$ we have

$$\frac{|f_0|^p}{2^p} \sum_{k=N}^{\infty} \frac{1}{(w_1 \cdots w_{n_k})^p} \leq \sum_{k=N}^{\infty} |x_{n_k}|^p \leq ||x||^p < \infty.$$

It follows that $\frac{1}{(w_1:::w_{n_k})^p} \to 0$. That is, there exists an increasing sequence $\{n_k\}$ such that $w_1 \cdots w_{n_k} \to \infty$ as $k \to \infty$.

Thus $|f_0|/2 < |w_1 \cdots w_{n_k} x_{n_k}|$ and so $\frac{|f_0|}{2(w_1 \cdots w_{n_k})} < |x_{n_k}|$ for all $k \ge N$. Hence we get that

$$rac{|f_0|^p}{2^p(w_1\cdots w_{n_k})^p}<|X_{n_k}|^p$$
, for all $k\geq N$.

Now since $x \in \ell^p$ we have

$$\frac{|f_0|^p}{2^p} \sum_{k=N}^{\infty} 1$$

Recall: A Zero-One Law for Orbital Limit Points

- with Seceleanu (2012): Let $T : \ell^p \to \ell^p$ be a unilateral weighted backward shift. The following are equivalent:
- (A) T is hypercyclic.
- (B) There is a vector whose orbit has a nonzero limit point.
- (C) There is a vector whose orbit has a nonzero weak limit point.
- (D) There is a vector whose orbit has in nitely many members contained in an open ball whose closure avoids the origin.

Proof of $\backslash (C) \implies (B)$ "

Let $x = (x_0, x_1, x_2, ...) \in \ell^p$ be a vector whose Orb(T, x) has $f = (f_0, f_1, f_2, ...) \in \ell^p$ as a non-zero <u>weak</u> limit point, with f_k

Proof of $\backslash (C) \implies (B)$ "

Let $x = (x_0, x_1, x_2, ...) \in \ell^p$ be a vector whose Orb(T, x) has $f = (f_0, f_1, f_2, ...) \in \ell^p$ as a non-zero <u>weak</u> limit point, with $f_k \neq 0$.

Considering the weakly open sets that contain f, we get that for all $j \geq 1$ there exists an $n_j \geq 1$ such that $|\langle T^{n_j} x - f, e_k \rangle| < \frac{1}{j}$.

That is $|w_{k+1}\cdots w_{k+n_j}x_{k+n_j}-f_k|<\frac{1}{j}$, for all $j\geq 1$.

Next, we inductively pick a subsequence $\{n_{j_k}\}$ of $\{n_j\}$ as follows:

- 1. Let $j_1 = 1$.
- 2. Once we have chosen j_m we pick $j_{m+1} > j_m$ such that

$$k + n_{j_m} < n_{j_{m+1}}$$
 and $\sum_{i=j_{m+1}}^{\infty} |x_{k+n_i}|^p \le \frac{1}{j_m \cdot ||T||^{p \cdot n_{j_m}}}$.

Thus we can assume, by taking a subsequence if necessary, that

$$\{n_j\}$$
 satis es $k + n_j < n_{j+1}$ and $\sum_{j=j+1}^{\infty} |x_{k+n_j}|^p \le \frac{1}{j \cdot ||T||^{p \cdot n_j}}$.

$\backslash (C) \implies (B)$ " Continued

Let
$$y = \sum_{i=1}^{\infty} x_{k+n_i} \cdot e_{k+n_i}$$
. Clearly y is in ℓ^p , because x is.

Then
$$T^{n_m}y = \sum_{i=1}^{\infty} x_{k+n_i} \cdot T^{n_m}e_{k+n_i}$$
. But $k+n_i < n_{i+1}$ for all $i \ge 1$ and so $k+n_i < n_m$ for all $i < m$. Thus since T is a unilateral backward shift we conclude that $T^{n_m}y = \sum_{i=1}^{\infty} x_{k+n_i} \cdot T^{n_m}e_{k+n_i}$.

$\backslash (C) \implies (B)$ " Continued

Let
$$y = \sum_{i=1}^{\infty} x_{k+n_i} \cdot e_{k+n_i}$$
. Clearly y is in ℓ^p , because x is.

Then $T^{n_m}y=\sum_{i=1}^{n_m}x_{k+n_i}\cdot T^{n_m}e_{k+n_i}$. But $k+n_i< n_{i+1}$ for all $i\geq 1$ and so $k+n_i< n_m$ for all i< m. Thus since T is a unilateral backward shift we conclude that $T^{n_m}y=\sum_{i=m}^{\infty}x_{k+n_i}\cdot T^{n_m}e_{k+n_i}$. Furthermore, since the vectors $T^{n_m}e_{k+n_i}$ and $T^{n_m}e_{k+n_j}$ have disjoint support for $i\neq j$, that is $\widehat{T^{n_m}e_{k+n_i}}(s)=0$ whenever $\widehat{T^{n_m}e_{k+n_j}}(s)\neq 0$, we have that

$$||T^{n_m}y - f_k e_k|| \le ||(w_{k+1} \cdots w_{k+n_m} x_{k+n_m} - f_k) \cdot e_k|| + ||\sum_{i=m+1}^{\infty} x_{k+n_i} \cdot T^{n_m} e_{k+n_i}||$$

$$\backslash (C) \implies (B)$$
" Completed

Thus,

$$||T^{n_{m}}y - f_{k}e_{k}||$$

$$\leq |W_{k+1} \cdots W_{k+n_{m}}X_{k+n_{m}} - f_{k}| + \left[\sum_{i=m+1}^{\infty} |X_{k+n_{i}}|^{p} \cdot ||T^{n_{m}}e_{k+n_{i}}||^{p}\right]^{1=p}$$

$$\leq \frac{1}{m} + \left[\sum_{i=m+1}^{\infty} |X_{k+n_{i}}|^{p} \cdot ||T||^{p \cdot n_{m}}\right]^{1=p} \leq \frac{1}{m} + \frac{1}{\sqrt[p]{m}} \to 0 \quad as \ m \to \infty.$$

$$\backslash (C) \implies (B)$$
" Completed

Thus,

$$||T^{n_{m}}y - f_{k}e_{k}||$$

$$\leq |w_{k+1} \cdots w_{k+n_{m}}x_{k+n_{m}} - f_{k}| + \left[\sum_{i=m+1}^{\infty} |x_{k+n_{i}}|^{p} \cdot ||T^{n_{m}}e_{k+n_{i}}||^{p}\right]^{1=p}$$

$$\leq \frac{1}{m} + \left[\sum_{i=m+1}^{\infty} |x_{k+n_{i}}|^{p} \cdot ||T||^{p \cdot n_{m}}\right]^{1=p} \leq \frac{1}{m} + \frac{1}{\sqrt[p]{m}} \to 0 \quad as \ m \to \infty.$$

Thus $T^{n_m}y \to f_k e_k$ in norm as $m \to \infty$, where $f_k e_k \neq 0$ in ℓ^p , and hence Orb(T, y) has a non-zero limit point. \square

Bergman Spaces

Let be a region in $\mathbb C$ and $H^\infty($) be the algebra of all bounded analytic functions on .

Let $A^2(\)=\{f:\ \to\mathbb{C}\,|\,f \text{ analytic, and }\int |f|^2\,dA<\infty\}$ be the Bergman space.

If $\varphi \in H^{\infty}(\)$, then we de ne $M_{\cdot}:A^{2}(\) \to A^{2}(\)$ by $M_{\cdot}f=\varphi f.$
